

# The Firebird Documentation Project

Writing Firebird Docs with  
DocBook XML

Frank Ingermann, Klar Partner AG

# Session Overview

## Part 1

- Who, Where, What
- What we have so far
- What is needed

## Part 2

- How to write docs

A hands-on introduction to DocBook XML

# Who, Where and What

- ***Paul Vinkenoog:***  
Project Coordinator, DocBook wizard, proof reader, copyright watchdog, „heart and soul“ of the Documentation Project
- ***Helen Borrie:***  
Compilation and maintainance of Release Notes, mailing list admin, thousands of bits and pieces...
- ***Norman Dunbar:***  
Reference manuals for command line tools
- ***Various others:***  
Articles, papers, translations into various languages

# Who, **Where** and What

- Mailing list:  
[firebird-docs@lists.sourceforge.net](mailto:firebird-docs@lists.sourceforge.net)
- CVS access (doc sources):  
**firebird.cvs.sourceforge.net (*manual* module)**
- Online access (finished docs):  
<http://www.firebirdsql.org/index.php?op=doc>

# Who, Where and **What**

- **The vision:**  
A complete, comprehensible, up-to-date set of documentation for Firebird
- **Complete:**  
You should find everything in the docs
- **Comprehensible:**  
It should be easy to understand
- **Up-to-date:**  
All Fb versions should be covered (2.0 + up)

# What we have so far

- Quick start guides
- User manuals
- Release notes
- Various papers
- Language Reference Update for 1.5
- *[ InterBase 6.0 Manuals ]*  
*Outdated, copyright issues*

# What is needed ?

- ***MOST WANTED: SQL Language Reference***
  - A (***the?***) Complete Reference of Firebird SQL+PSQL from V1.0 (at least V2.0) to V2.5 and beyond...
- Translations
  - Make the docs available in Italian, Portuguese, French, German, Russian, (...) language
- Consolidation
  - Bring all the bits and pieces together

## Part 2: How to write docs

- What is DocBook XML?
- Why DocBook?
- How does it work?
- Setting up a build environment
- Editing tools
- Practical example: „My first Firebird Doc“

# What is DocBook XML?

DocBook „home“: <http://www.docbook.org>

- DocBook is an ***XML Schema***  
designed for writing books and papers about  
computer hard- and software
- **Key feature:**  
Strict separation of **content** (text) and  
**representation** (formatting, fonts...)

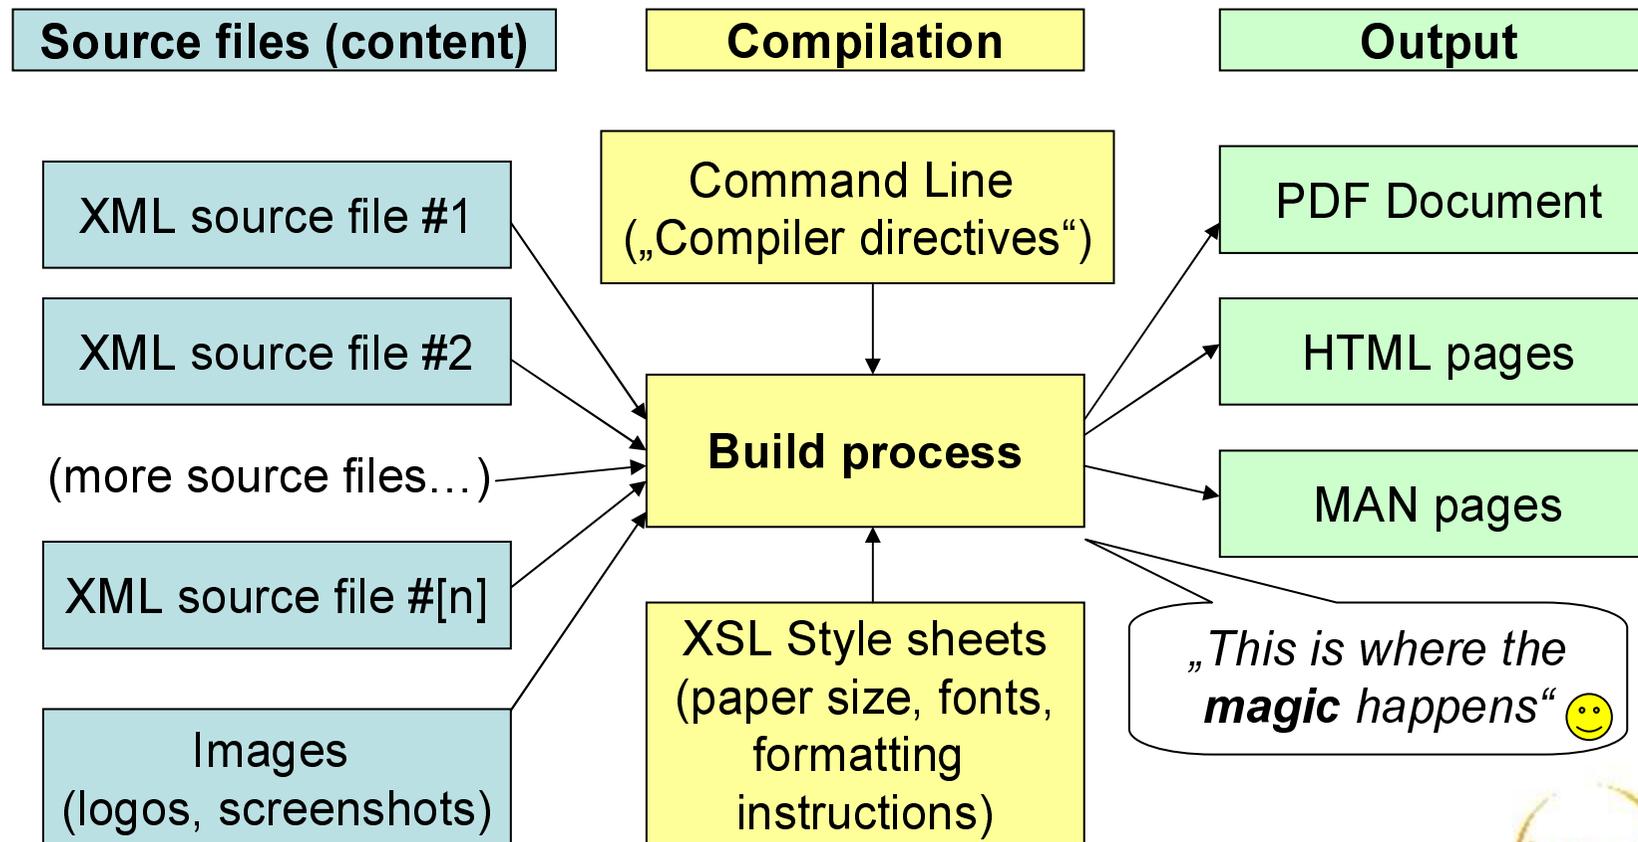

# Why DocBook?

- **Modularity**
  - Books, Articles, Chapters in *separate source files*
  - Can be INCLUDED into bigger docs
- **Various output formats**
  - PDF, HTML, MAN pages from the *same sources*
- **plain text format**
  - Editing with any text editor
  - CVS: same version control as Firebird
- **Focus on content**
  - Author just writes content
  - doesn't care about formatting output, fonts etc.

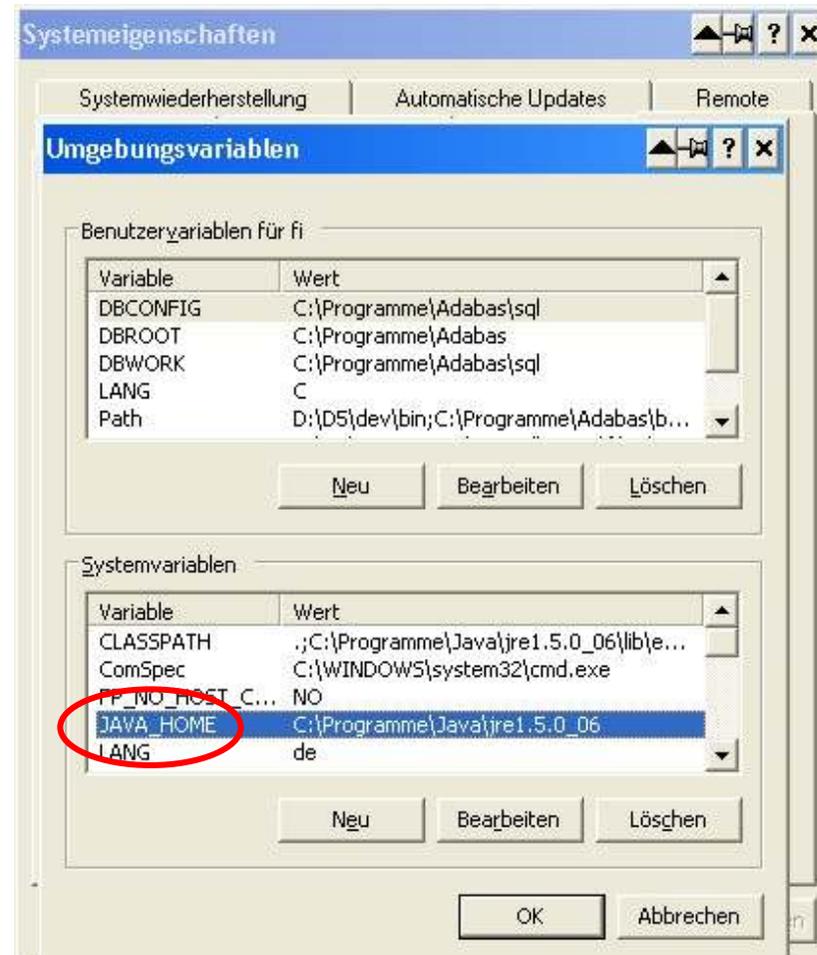

# How does it work?

Basically, DocBook works just like a compiler:

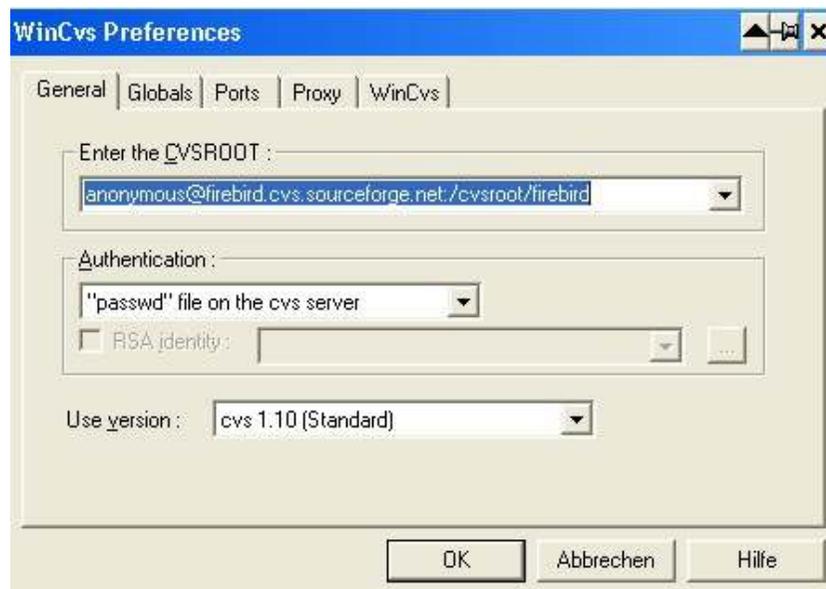

# Setting up #1: Get Java

- Download + install Java (JRE)
- Set the **JAVA\_HOME** environment variable

# Setting up #2: CVS Checkout

- **Check out Manual module from CVS**
  - Set the CVS root
  - Checkout „manual“

# Manual tree after cvs checkout

- **Config**
  - config settings for „fo“ (formatting objects)
- **Lib**
  - Java libs for the build process
- **Src**
  - XML source files (content) and **build.bat**
- **Tools**
  - DocBook dtd and stylesheets (formatting, fonts,...)

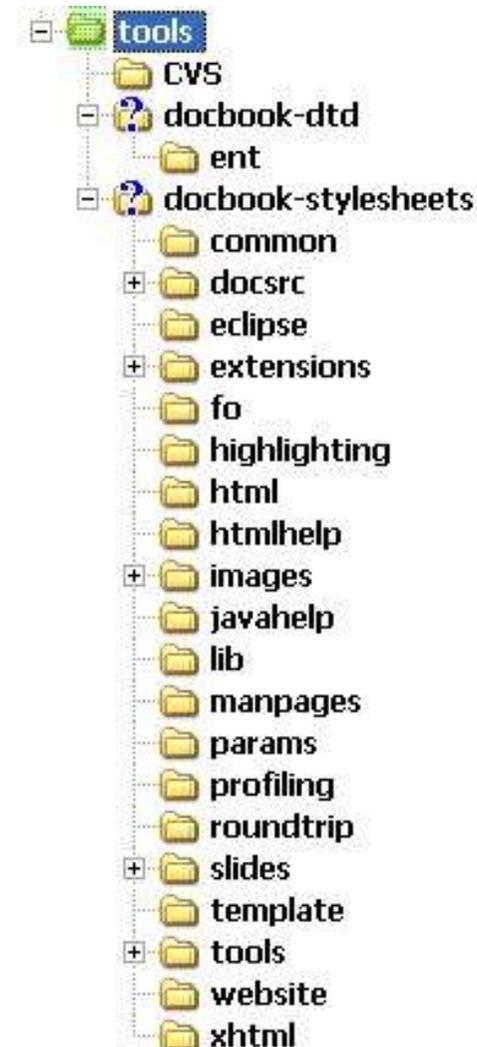

# Setting up #3: Get the tools

- Go to <http://www.firebirdsql.org/doctools/>
- Download and unzip everything into the `tools` dir

Index of /doctools/

2008-07-04	10:01:37		(dir)
<hr/>			
2007-04-15	10:05:08	<a href="#">00-README.TXT</a>	184 bytes
2007-04-15	09:15:41	<a href="#">docbook-dtd.zip</a>	96 KB
2007-04-15	09:18:40	<a href="#">docbook-stylesheets.zip</a>	3 MB

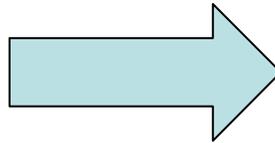

# Setting up #4: Get the libs

- Go to <http://www.firebirdsql.org/doclibs/>
- Download and unzip ALLJARS.ZIP into the lib dir

## Index of /doclibs/

2008-07-04	10:01:37	<a href="#">..</a>	(dir)
2007-04-15	08:47:07	<a href="#">old</a>	(dir)
<hr/>			
2007-04-15	09:58:39	<a href="#">00-README.TXT</a>	177 bytes
2007-04-15	10:05:55	<a href="#">ALLJARS.ZIP</a>	9 MB
2007-04-15	08:48:52	<a href="#">ant-launcher.jar</a>	9 KB

Name	Größe
CVS	
_readme_libs.txt	1 KB
<b>ALLJARS.ZIP</b>	8.768 KB
ant-launcher.jar	9 KB
ant-trax.jar	68 KB
ant.jar	1.010 KB
avalon-framework.jar	85 KB
batik.jar	2.563 KB
commons-io-1.1.jar	61 KB
commons-logging-1.0.4.jar	38 KB
fop-hyph.jar	717 KB
fop.jar	1.987 KB
foxon.jar	10 KB
jai_codec.jar	209 KB
jai_core.jar	1.540 KB
jimi-1.0.jar	445 KB
saxon-xml-apis.jar	65 KB
saxon.jar	557 KB
xmlgraphics-commons-1.1...	295 KB

# Setting up: Test-run the build

- Open a command line in the *src/build* dir, run „**build pdf**“

```
D:\docbook\manual\src\build>build pdf
java version "1.5.0_06"
Java(TM) 2 Runtime Environment, Standard Edition (build 1.5.0_06-b05)
Java HotSpot(TM) Client VM (build 1.5.0_06-b05, mixed mode, sharing)

Unable to locate tools.jar. Expected to find it in C:\Programme\Java\jre1.5.0_06\lib\tools.jar
Buildfile: build.xml

init:
    [echo] Apache Ant version 1.6.5 compiled on June 2 2005

prepare:

getrootarg:

getfontargs:

fo:
    [echo] Building Formatting Objects file. Please wait...
    [delete] Deleting: D:\docbook\manual\inter\fo\firebirddocs.fo
    [java] Making portrait pages on A4 paper (210mmx297mm)

copy-images:

copy-img-files:
    [copy] Copying 1 file to D:\docbook\manual\inter\fo\images

copy-img-files:
    [copy] Copying 7 files to D:\docbook\manual\inter\fo\images

copy-img-files-not:

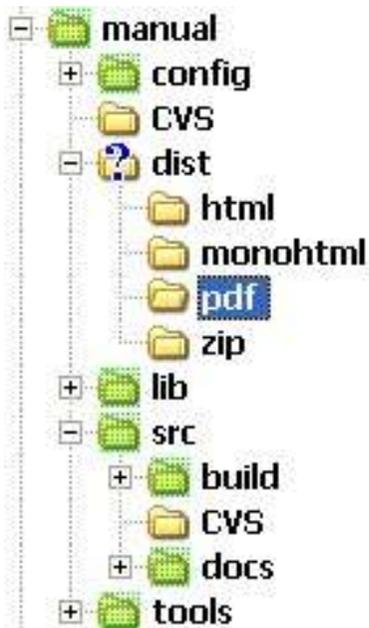

fo2pdf:
    [echo] Building PDF from Formatting Objects. Please wait...
    [fop] 12.07.2008 12:08:32 org.apache.fop.apps.FopFactory configure
    [fop] INFO: Initializing FopFactory Configuration
```

# Setting up: Verify the build

- After some time, you should get:

```
pdf :  
BUILD SUCCESSFUL  
Total time: 1 minute 6 seconds  
D:\docbook\manual\src\build>
```

- In the `\dist\pdf` dir you will find:

Name	Größe	Typ
firebirddocs.pdf	2.383 KB	PDF Document

# Docwriting workflow

- Write doc(s) with XMLMind or text editor
- Build doc set as HTML and/or PDF
- Proof-read, correct errors, build again
  - *Tip: don't proof-read yourself, contact the mailing list and find someone to help you!*
- Add new files to CVS
- Commit new/modified files to CVS
- Keep your docs up-to-date

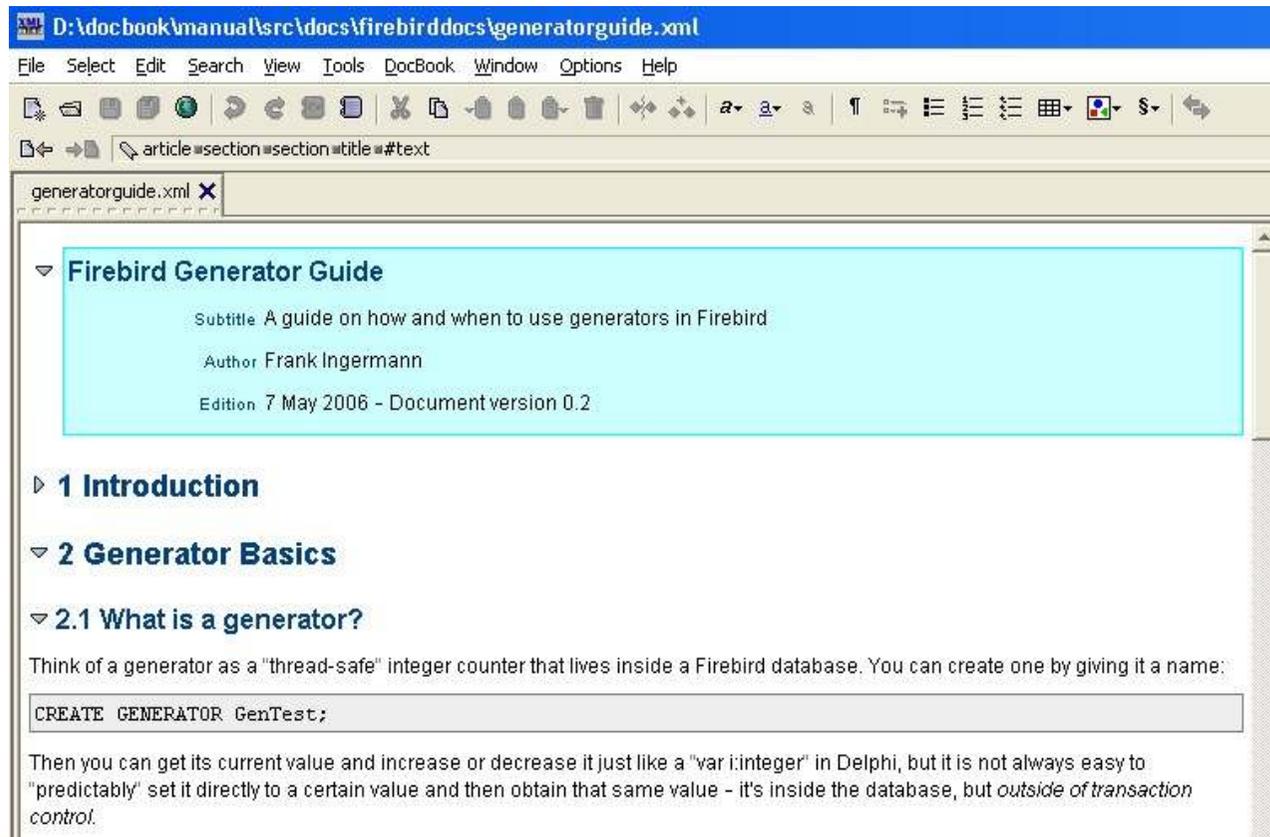

# Editing Tools for DocBook

- Simple: plain text editors
  - VI, Notepad (*argh...*)
  - „decent“ **text editor** with syntax highlighting
- Advanced XML-aware editors:
  - Dedicated XML Editors
  - e.g. **XMLMind** (Free edition)
  - has built-in DocBook support

# Editing in XMLMind

- Checks XML structure, knows DocBook, „almost WYSIWYG“

# Building Doc sets

Use [build.bat](#) in `\manual\src\build`:

```
build <target> [<options>]
```

```
<target> = pdf | html | monohtml
```

```
build html      builds multi-file html docs
```

```
build monohtml  builds a single, huge html file
```

# Building non-english docs

Use „-Dsfx=<languagecode>“ option:

(sfx = **s**uffix for the **s**rc directory and all **x**ml files)

`build pdf -Dsfx=de` builds the German doc set

```
D:\docbook\manual\src\build>build pdf -Dsfx=de
java version "1.5.0_06"
Java(TM) 2 Runtime Environment, Standard Edition (build 1.5.0_06-b05)
Java HotSpot(TM) Client VM (build 1.5.0_06-b05, mixed mode, sharing)

Unable to locate tools.jar. Expected to find it in C:\Programme\Java\jre1.5.0_06\lib\tools.jar
Buildfile: build.xml

init:
  [echo] Apache Ant version 1.6.5 compiled on June 2 2005

prepare:

getrootarg:

getfontargs:

fo:
  [echo] Building Formatting Objects file. Please wait...
  [delete] Deleting: D:\docbook\manual\inter\fo\de\firebirddocs-de.fo
  [java] Making portrait pages on A4 paper (210mmx297mm)
```

Language codes: it, es, de, ru, pt\_br, fr, ja, nl

# Building a part (set) of the Docs

Use the `-Dbasename` option:

```
build pdf -Dbasename=rlsnotes
```

Builds **rlsnotes.pdf** containing *only* the release notes

```
basename = firebirddocs (default) |  
          rlsnotes | papers | refdocs
```

## *Before you start writing:*

- **Read the DocWriting How-To**  
*Really, really read it! It's worth it !!*
- **Pick a topic**  
You think you know everything about it?  
*Write documentation, and find out how little you knew! ;-)*
- **Announce it in the mailing list**  
Get Together & Don't duplicate work!

# DocBook structure elements

- **<set>**  
Top-level: a set of <book>s make a doc **set**
- **<book>**  
A <book> contains articles and/or chapters
- **<article>** or **<chapter>**  
An article or chapter contains sections
- **<section>**  
A section contains **paragraphs**
- **<para>**  
Bottom-level: a paragraph holds a block of text together

# DocBook formatting elements

Some examples:

`<programlisting>` for SQL statements,  
command line, ISQL etc.

`<example>` for – guess what 😊

`<tip>` for tips (in blue boxes)

`<emphasis>` to highlight words or terms

See Paul Vinkenoog's „Firebird Docwriting Guide“  
for more !

# DocBook IDs

- Any structure element can have an **ID**  
( *an IDentifier is a **text label** in DocBook!* )
- IDs can be used for hyperlinks
- IDs can be used to include XML files into others
- IDs **MUST BE UNIQUE** throughout all files in one SET (!)

# DocBook Set example

```

<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE set PUBLIC "-//OASIS//DTD DocBook XML V4.5//EN" "../tools/docbook-dtd/docbookx.dtd" [
  <!ENTITY fbutilities-intro SYSTEM "firebirddocs/fbutil_intro.xml">
  <!ENTITY fbutilities-gsec SYSTEM "firebirddocs/fbutil_gsec.xml">
]>

<set id="firebird-docset">
  <title>Firebird Documentation Set</title>
  <!-- top-level element is the "set" -->
  <!-- defines the title of the set -->
  <book id="firebird-database-documentation">
    <!-- starts a "book" inside the "set" -->
    <bookinfo>
      <title>Firebird Database Documentation</title>
      <!-- defines the title of this book -->
    </bookinfo>
    <article id="generatorguide">
      <!-- starts an article inside the book -->
      <!-- content of the article goes here... -->
    </article>
    <!-- closes the article -->
    <!-- ...more articles of the book here... -->
  </book>
  <!-- closes the first book -->
  <book id="fbutils">
    <!-- starts the second book in the set -->
    <bookinfo>
      <title>Firebird Commandline utilities</title>
    </bookinfo>
    &fbutilities-intro;
    &fbutilities-gsec;
    <!-- this includes the intro article -->
  </book>
  <!-- closes the second book -->
</set>
  <!-- closes the entire set -->

```

# DocBook Article example

- Each `<article>` should be in a separate file  
*(not necessary, but keeps things more modular!)*

```
<article id="generatorguide">                                <!-- starts an article inside the book -->
  <articleinfo>
    <title>Firebird Generator Guide</title>
  </articleinfo>
  <section id="generatorguide-intro">                        <!-- first section in the article -->
    <title>Introduction</title>
    <section id="generatorguide-intro-about">               <!-- sub-section inside a section -->
      <title>what is this article about?</title>
      <para>This article explains what Firebird
        generators are,...</para>                          <!-- text in a "para" is kept together -->
    </section>
    <section id="generatorguide-intro-forwhom">             <!-- each ID must be UNIQUE! -->
      <title>who should read it?</title>
      <para>Read this article if you...</para>
    </section>
  </section>                                               <!-- closes the innermost section -->
</section>                                               <!-- closes the outer section -->
<!-- ...more sections here... -->
<appendix id="generatorguide-dochist">                     <!-- starts an appendix to the book -->
  <title>Document history</title>
  <!-- content of the appendix goes here... -->
</appendix>                                               <!-- closes the appendix -->
</article>                                                 <!-- closes the article -->
```

Now let's write some docs!

***Your Doc team needs you!***
